# Soluble Lead Flow Battery **Technology**

**General Atomics &** University of California, San Diego

David M. Keogh

March 2, 2011

### **Conventional Lead Acid Battery**

### Dominant Energy Storage Technology for 100+ yrs

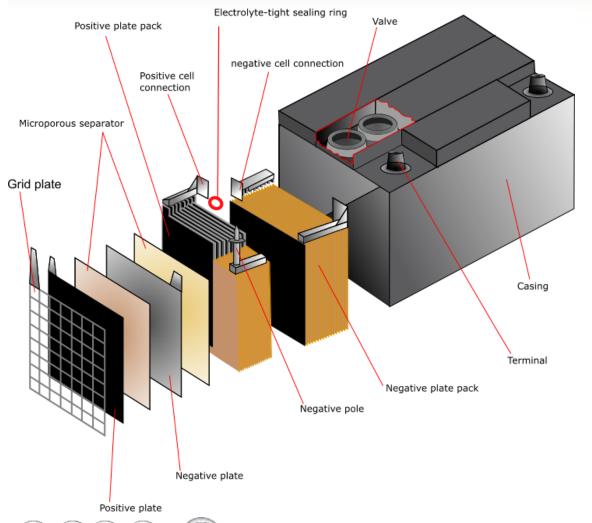

# Advantages

- Low cost
- Good efficiency
- Safety, Reliability

### **Conventional Lead Acid Battery**

# Current State-of-the Art

- \$180-200 /kWh
- 1000 deep cycles

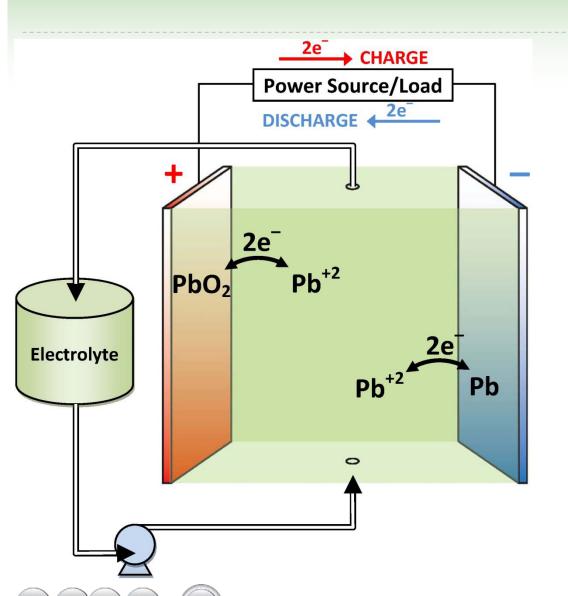

# Our / GRIDS Goal

- <\$100 /kWh
- >5000 deep cycles

### **Grid Scalable Lead Acid Battery**

### **Innovations**

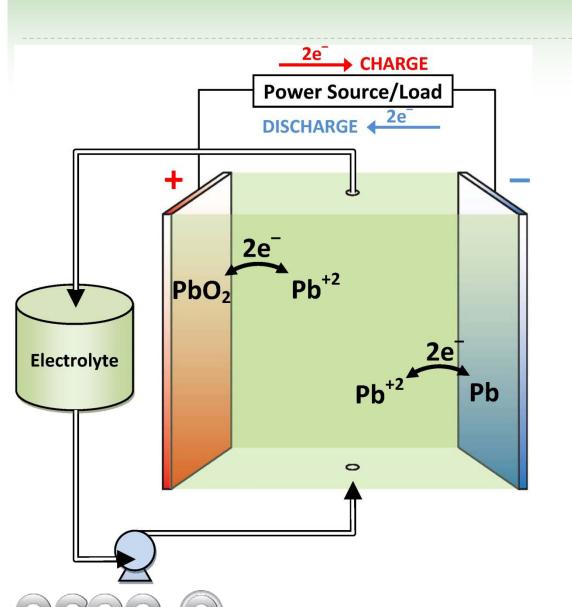

- MSA-based electrolyte
- Carbon-based electrodes
  - Flow-battery design

### **Impact**

- Cost Reduction
  - Grid Scalable
- Cycle-life Improvement

### **Soluble Lead Chemistry**

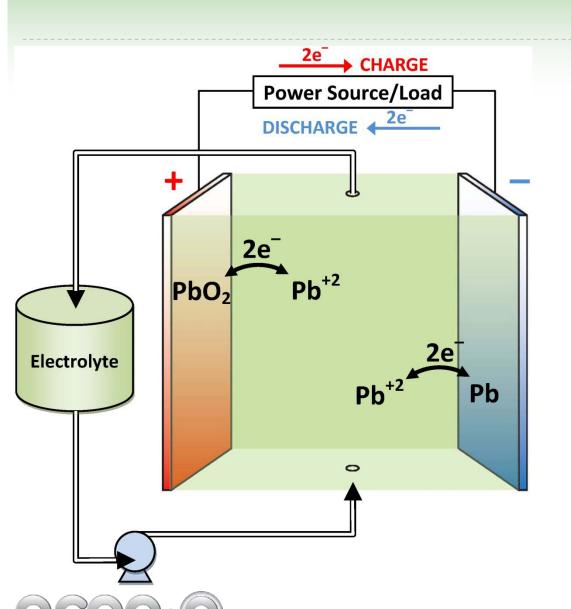

Anode  $Pb^{2+} + 2e^{-} \rightarrow Pb$  Cathode  $Pb^{2+} + 2H_{2}O \rightarrow PbO_{2} + 4H^{+} + 2e^{-}$ 

Cell Potential 1.76V Energy Density 65Wh/kg, 95Wh/L

### **Unique Flow Battery Design**

**Design Features** 

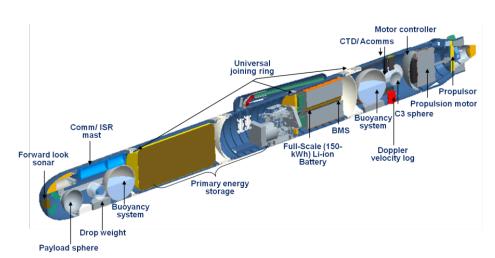

- 1) Single Electrolyte
- 2) No membrane or separator required
- 3) Simplifies Balanceof-Plant

### **GA/UCSD** Core Strengths

#### **General Atomics**

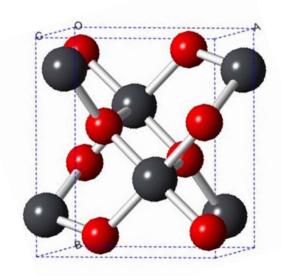

- Energy storage expertise (flywheels, SMES, thermalchemical)
- Chemistry Labs and Battery
  Test Facilities

#### **GA Unmanned Underwater Vehicle**

### **UCSD**

- Laboratory for Energy Storage & Conversion (Prof. Shirley Meng)
- Materials Synthesis, Modeling & Computation, Characterization

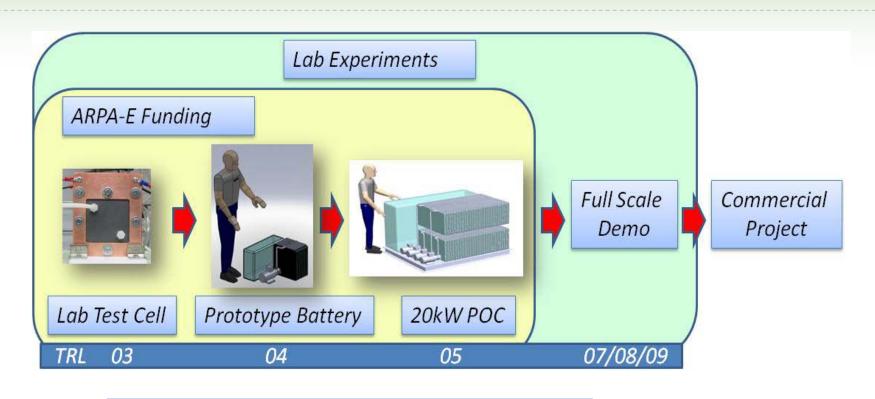

Alpha-PbO<sub>2</sub>

### **Project Overview / Status**

Single Cell Testing

Flow Battery Prototype

20kW Proof-of-Concept
